Project Description

116th St SE/56th Ave SE Intersection project will improve the sight distance at the intersection.

The existing curb ramps will be removed and new ADA-compliant curb ramps will be installed at the intersection.

Existing Conditions

The existing road grades at the intersection are as follows:

```
116<sup>th</sup> St SE (West Leg) = (-) 9.6% (Arterial)

116<sup>th</sup> St SE (East Leg) = (-) 13.1%

56<sup>th</sup> Ave SE (South Leg) = (+) 4.18%

56<sup>th</sup> Ave SE (North Leg) = (-) 5.36% (Arterial)
```

The south leg of the intersection was temporarily closed to traffic due to insufficient sight distance. A new development is being constructed at the northeast corner of the intersection. There are two retaining walls: one at the northeast corner and one at the southwest corner.

None of the existing ramps at the intersection met the current ADA standards (2005 PROWAG).

Proposed Improvements

To improve the sight distance and provide better traffic management and traffic control a mini roundabout was proposed at the intersection. The mini roundabout and the circulatory roadway were benched to provide a relatively flat slope at the intersection to provide sight distance and pedestrian access. The layout of the splitter islands along all legs of the intersection will better channel traffic through the intersection. The following are the proposed road grades:

```
116<sup>th</sup> St SE (West Leg) = (-) 12.65%
116<sup>th</sup> St SE (East Leg) = (-) 16.28%
56<sup>th</sup> Ave SE (South Leg) = (+) 4.18%
56<sup>th</sup> Ave SE (North Leg) = (-) 7.84%
```

The proposed road profile is steeper due to:

- 1. Benching for the mini roundabout
- 2. Match the project at the next intersections on 116th (east and west), without re-grading the road into the next intersections which is outside the project scope.

ADA Compliance requirements.

Compliance with ADA will control the design of six components of this project. The ADA design requirements are:

| Pedestrian Accessible Route: | Width =4' min. | | | | | |
|------------------------------|-----------------------------------|--|--|--|--|--|
| Sidewalks | | | | | | |
| Sidewalk grades | Not to exceed attached road grade | | | | | |
| cross-grades | 2.0% max. | | | | | |
| Ramps | | | | | | |
| Ramp grades | 8.3% max. | | | | | |
| cross-grades | 2.0% max. | | | | | |
| Landings | 2.0% max., all directions | | | | | |
| Counter slopes | 5% max | | | | | |

Justification for Maximum Extent Feasible

Pedestrian crossing on the west leg of 116th St SE has been eliminated due to minimal sight distance and because of an existing retaining wall blocking the sight distance. A warning sign will be posted with a "Use Crosswalk" sign to direct pedestrians to the adjacent crosswalk.

The cross slope of 5% could not be met on the crosswalks due to the following reasons:

Even though the intersection was benched to improve the sight distance at the intersection, the benching could not be extended to the pedestrian crosswalk due to the project limit scope which would require extending the project limits into the next intersection (re-grading into the adjacent intersection) at the east and west project limits on 116th St SE. Due to the existing steep grades of the road profile, retaining walls at the northeast corner and northwest corner, and the limits of the projects scope, the standards for the cross walk grades could not be achieved. The cross walk follows the road profile and hence the cross walk slope does not meet the ADA grade of 5%.

However the curb ramps and the pedestrian facilities, the crosswalk cross slopes and landing have been improved over the existing conditions, as shown in the attached spreadsheet. The cross walk grades were minimized to the maximum extent feasible by positioning these as close to the circulating roadway (roundabout) as possible.

The roundabout layout at the intersection improved the sight distance, pedestrian facility and better traffic control at the intersection from the existing conditions.
